Imagine yourself helping Taylor Swift following her "Eras Tour first show." Taylor is curious about her performance and the groups of songs her audience connected most with them. She receives comments for every song on her setlist: some calm the audience down a bit (***and have a negative score***), while others get the crowd quite thrilled (***and have a positive score***).

Taylor can choose any song to start her performance, but she likes to keep the flow in order. So the next song she sings has to be the one right after she has chosen the starting song on the list, regardless of the public reactions.

Given a list of scores for each song (indicating how much they boost or calm the crowd), can you:

[-3, 7, 12, -8, -2, 83, -7, 4]

i. Help Taylor determine which segment of consecutive songs she should perform at her next concerts to maximize audience interest. What is the total comment score of this segment? **Simulate** with proper steps.
